

Project Design Phase
Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-1951
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The standard ServiceNow Incident form does not react to what the user does. Fields are not guided as conditions change, and most validation happens only after the form is submitted, so incorrect or incomplete data gets entered. How might we give Incident users immediate guidance and stop invalid data at the correct event using UI Policies and Client Scripts?
2.	Idea / Solution description	Combine declarative UI Policies with event-based Client Scripts on the Incident form: • UI Policy Control – sets Incident field state (mandatory, read-only, visible) dynamically. • UI Policy Action – applies field-level behaviour, e.g. on Urgency. • onChange Client Script – reacts to field changes. • onSubmit Client Script – validates data before save. • onCellEdit Client Script – validates inline list edits.
3.	Novelty / Uniqueness	The solution uses the right tool at the right event: declarative UI Policies for field behaviour and Client Scripts for event-based validation, all on the client side without submitting the form. It is fully rule-based and does not require AI or machine learning.
4.	Social Impact / Customer Satisfaction	Service desk agents get clear, immediate guidance, which reduces confusion and mistakes. Cleaner incident data means less rework and faster resolution for callers, giving better support experience and higher satisfaction.
5.	Business Model (Revenue Model)	No direct revenue – this is an internal configuration built on the existing ServiceNow platform with no extra licence cost. Value comes from saved agent time, fewer reopened incidents and better data quality. It can be offered as a reusable configuration / update set for other teams.
6.	Scalability of the Solution	UI Policies and Client Scripts run in the user's browser, so they scale with the number of users on the instance. The configuration can be moved between instances with Update Sets and extended to other forms and tables (e.g. Problem, Change) by reusing the same pattern.
