

Implement Client Script & UI Policy (Incident)

SCENARIO Creating, editing and saving an incident on the ServiceNow Incident form				1Entice How does someone initially become aware of the need to log an incident?			2Enter What do people experience as they begin to open the Incident form?			3Engage In the core moments of filling the form, what happens?			4Exit What do people typically experience as they save the incident?			5Extend What happens after the incident is saved?																																
SSteps What does the person (or group) typically experience?				Customer reports an issue A caller contacts the service desk about a problem that needs to be logged.			Agent opens Incident app The agent logs in to the ServiceNow instance with an admin or developer role.			Start a new incident The agent selects New in the Incident module to begin.			Incident form loads The form opens in the browser with default field values.			UI Policy applies on load Fields are made mandatory, read-only or visible as per the policy conditions.			Enter caller details The agent fills caller, short description and category.			Change Urgency The agent selects or changes the Urgency of the incident.			onChange script reacts The Client Script runs instantly when the field value changes.			Fields update dynamically Dependent fields and messages update without submitting the form.			Click Save The agent clicks Save or Submit once the details are filled.			onSubmit validation The Client Script checks the data before the record is sent to the server.			Incident saved or blocked Valid data is saved; incorrect data is stopped with a clear message.			Edit in list view The agent edits a value directly in the incident list.			onCellEdit check The onCellEdit Client Script validates the list edit.			Review & improve The team tests the configuration and refines the policies and scripts.		
IInteractions What interactions do they have at each step along the way?				Incident module in the ServiceNow instance (browser)			ServiceNow login page and Incident application			Incident > Create New (Next Experience UI)			Incident form view			UI Policy engine evaluating form conditions			Incident form fields: Caller, Category, Short description			Urgency field and related fields on the form			Client Script (onChange) using g_form APIs			UI Policy Action on the Urgency field			Save / Submit button on the form			Client Script (onSubmit) - Save validation			Info / error message shown on the form			Incident list view (cell editing)			Client Script (onCellEdit)			System UI > UI Policies & Client Scripts; Demo and GitHub links		
GGoals & motivations At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")				Help me log this problem quickly			Help me get to the right application			Help me start a new record with no hassle			Help me see only the fields I need			Help me avoid skipping required fields			Help me enter correct caller information			Help me set the right urgency			Help me see what changes when I update a field			Help me avoid conflicting field values			Help me save without errors			Help me avoid saving incorrect data			Help me know why a save was blocked			Help me make quick edits in the list			Help me keep list edits consistent with the form			Help me see ways to improve the form		
+Positive moments What steps does a typical person find enjoyable, productive, fun, motivating or exciting?				Form behaviour feels guided and clear									Fields appear or become mandatory automatically									Instant response – no page reload needed			Dependent fields stay consistent						Incorrect data is stopped before it is saved						Same rules apply in the list view											
-Negative moments What steps does a typical person find frustrating, confusing, angering, costly or time-consuming?										Too many empty fields can confuse new users									Missing mandatory fields are noticed late									Unexpected validation messages can interrupt the agent						Blocked saves need clear wording to be understood			Rules behave differently if list edits are not covered											
!Areas of opportunity How might we make each step better? What ideas do we have?							Add short help text to guide new agents									Use UI Policy instead of scripts wherever possible									Show helpful on-screen messages when values change						Provide clearer, user-friendly error messages						Test onCellEdit on all key list fields			Document the scripts and add Demo + GitHub links
