

Project Design Phase-II Technology Stack (Architecture & Stack)

Date	03 October 2026
Team ID	SWTID-2026-1951
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Technical Architecture:

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

Example: Implementing Client Script & UI Policy on the ServiceNow Incident form

Reference: <https://developer.servicenow.com/>

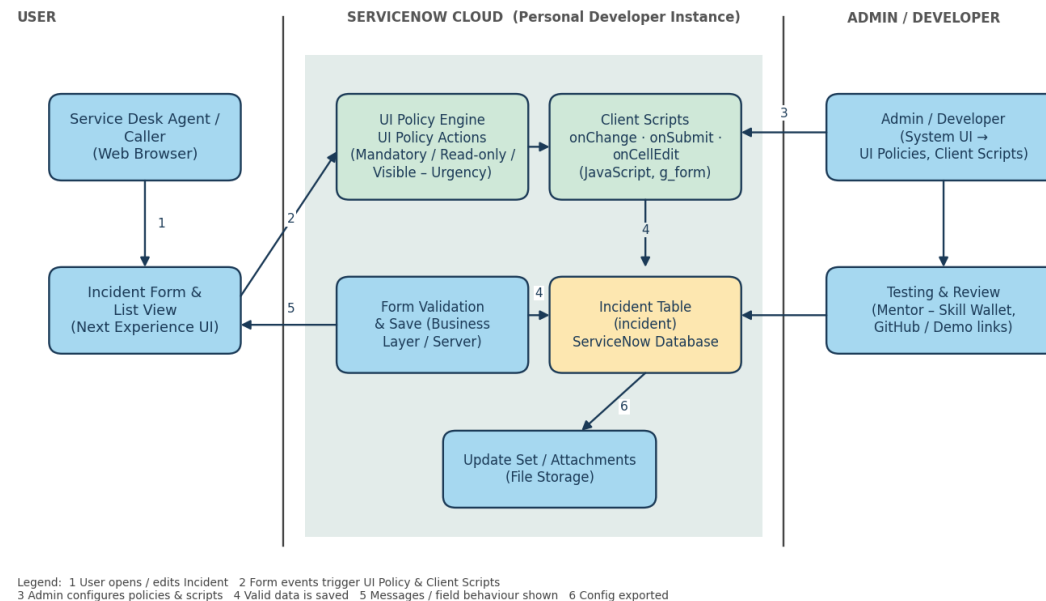

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
------	-----------	-------------	------------

1.	User Interface	How the user interacts with the application – ServiceNow Incident form and list view in the browser	ServiceNow Next Experience UI / Classic UI (HTML, CSS, JavaScript) on Chrome, Edge or Firefox
2.	Application Logic-1	Client Scripts that control form behaviour: onChange (react to field changes), onSubmit (save validation), onCellEdit (list editing)	JavaScript with ServiceNow client APIs (g_form, g_user)
3.	Application Logic-2	UI Policy on the Incident form to make fields mandatory, read-only or visible without scripting	ServiceNow UI Policy (conditions + UI Policy Actions)
4.	Application Logic-3	UI Policy Action on the Urgency field to enforce field behaviour based on incident conditions	ServiceNow UI Policy Actions (Urgency)
5.	Database	Incident records (task-based table) storing caller, category, urgency, impact, priority and state	ServiceNow relational database – Incident [incident] table
6.	Cloud Database	Database service hosted by the ServiceNow platform on the cloud instance	ServiceNow cloud-hosted instance (Personal Developer Instance)
7.	File Storage	Storage of configuration changes and attachments for the project	ServiceNow Update Sets / platform attachments; GitHub for project files
8.	External API-1	Purpose of External API used in the application – not required; client-side platform APIs are used	ServiceNow Client APIs (GlideForm, GlideUser)
9.	External API-2	Purpose of External API used in the application – not used in this project	Not applicable
10.	Machine Learning Model	Purpose of Machine Learning Model – not used in this project	Not applicable
11.	Infrastructure (Server / Cloud)	Application deployment on Cloud Local Server Configuration: Not required – runs in a web browser Cloud Server Configuration: ServiceNow Personal Developer Instance (PDI) with Incident Management enabled	ServiceNow PDI (Cloud); admin / developer role access

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	Client-side logic is written in standard JavaScript; project source is shared through a public repository	JavaScript (ECMAScript), GitHub

2.	Security Implementations	Role-based access (admin / developer) for creating scripts and policies; platform ACLs protect incident data; client scripts are paired with server-side checks	ServiceNow roles & ACLs, HTTPS / TLS
3.	Scalable Architecture	Multi-tenant cloud platform; UI Policies and Client Scripts run in the user's browser, so form logic scales with the number of users	ServiceNow platform (multi-tier)
4.	Availability	Hosted on ServiceNow cloud infrastructure with platform-managed uptime and backups	ServiceNow cloud instance
5.	Performance	Form rules run on the client and respond instantly, without submitting the form or an extra server round trip	UI Policy, onChange Client Script
